

Femexin 28

COMPOSITION

Each white coated tablet contains: Levonorgestrel 0.100 mg, ethinylestradiol 0.020 mg, and excipients (q.s.)

Each red tablet (dummy medication) contains excipients (q.s.)

DRUG ACTION

Oral contraceptives act by gonadotrophin suppression. Although the main mechanism is the inhibition of ovulation, there are pharmacological actions that include changes in the cervical mucus and endometrium, which hinder the flow of sperm cells through the cervix and the implantation of the fertilised egg in the uterus.

DOSAGE

Take 1 pill of Femexin 28 per day, preferably by night, without interruption for 28 days (1 white pill every day for the first 21 days and one red pill for the remaining 7 days), without taking a break between 2 packs.

PRESENTATION

Packs containing 21 white (active) tablets and 7 red tablets (placebo)
