

Paraclim

COMPOSITION

Each coated tablet contains tibolone 2.5 mg and excipients (q.s.)

DRUG ACTION

This medicine is used to treat the climacteric syndrome after one year of natural menopause or immediately after surgical menopause.

DOSAGE

The recommended initial dose for treatment of climacteric symptoms is 1 daily tablet of 2.5 mg. Generally, symptoms improve within a few weeks. Best results are found when the treatment lasts at least three consecutive months. You can take the tablets with water or any other fluid, at the same time each day, if possible. Dose adjustments are not required in elderly patients.

PRESENTATION

Pack containing 30 coated tablets.
